

## How to make an anti-wasp entrance tube:

1. Cut a length of corex

2. Wrap around a former, in this case a length of square wood and fix together with duck tape

3. Cut an entrance on one side

4. Drill air holes on the opposite side

5. Attach the entrance to the entrance block with duck tape, ensure entrance holes line up

### How it works:

- Wasp smells entrance through the air holes so is attracted to there
- Wasp does not like entering a dark tube and will not learn that the new entrance has moved
- Bees will learn to use the ends of the tube for its entrance

### Considerations:

- If bees cannot find the new entrances, cut the length of the tube down
- Ensure the entrance block is reduced
